Inspiration, Intent, and Challenges

I love the storytelling of the 'what-ifs' story which is basically the imagined world where one incident leads to long term consequences. Not only does it affect a society, but also individual members of the society. I want to explore the concept of nomad or migration, when a group of people would relocate to different places once a certain amount of time passes. So my focus is to depict a group of people and their home. Challenges for me would be the design aspect because the environment that I want doesn't exist in real life, but has to be translated from my imagination.

World Description

Set in 2074, climate change has turned most of our Earth surface to body of water. On one of the few habitable land, where it used to be a mountain top, there is a small fisherman village that lives in isolation of the unknown outside world. The villagers are generations of fishermen who know how to handle life with water and have to relocate several times once every couple of years to avoid floods. The 'old world' is the Earth before 2038 when flooding started to accelerate and completely flood the main cities around the world by 2040. The world map is not recognizable anymore. Only a couple of generations have been experiencing the changes and the generation that experienced the old world has passed.

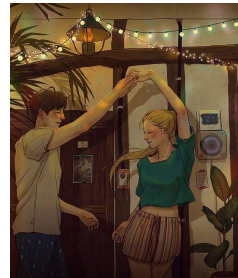

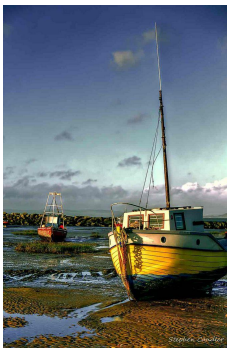

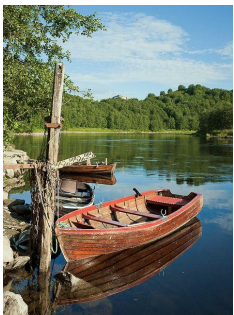

As the villagers live in a very small community, they tend to ignore the old world's stereotypes and values which are not necessary for them anyway. The idea of religion, race and beauty standards change where everyone don't care about the old social value. Religion doesn't exist because the young villagers didn't grow up with a religious institution and the older generations focused more on adapting their new life and doesn't have a proper structure in terms of preserving their belief system. Over decades, the villagers are very adaptive and happy to live mundane life and embrace the connection between the remnants of old world civilization and nature.

The animals also have developed their anatomy to be able to survive under water. They are either evolving or extinct. Deers now have fins and gills, and are a great source of protein for the villagers. The villagers would build boats from scratch, the debris from the old world has great material for them to use for hunting and transportation. One thing that they kept developing is science and knowledge. They would write and collect books as whatever knowledge is useful for their survival. They have a method to convert seawater to drinking water, a method to preserve meat or grow plants from water.

Media and Size : This project will be drawn digitally using Sketchbook App on iPad. The ratio of the drawings will be 16:9
